Set the context combined state name to default

- Type: Enhancement
- Not it is possible to use an asterisk character as a placeholder for the CREO default combined state name in the definition of a context.

▼ ☆ Context		
• Label	Function	T Label which is shown to the user.
• Description	Colors and rules for functional aspe	T Description which is shown to the user.
• Inherit contents	<input checked="" type="checkbox"/>	Inherit assigned contents from the superordinated context.
• Parameter Value	Function	Value for the global context parameter to pre-set this context for the user.
• Combined State	*	Name of the combined state which shall be linked to this context. This is mandatory for color symbol creation.

- This makes it possible to create a configuration in which language-unspecific the default combined state can be used.
