

What's new

SMARTElectrode 12.0.0.0

New UI Post-Processor

ENHANCEMENT

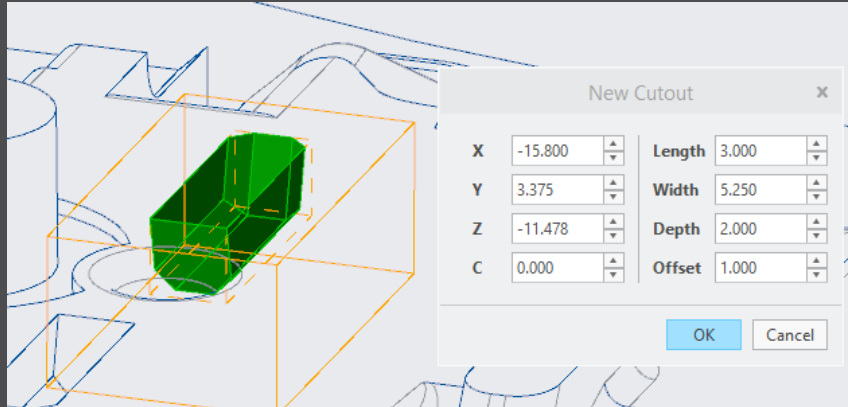

TECHN. INFORMATION

In addition to existing general output functionality, version 12.0 introduces a new specific Post-Processor UI with newly developed interfaces to EDM. This newly developed feature is available at extra cost and needs a demo license or an extended commercial license for activation. All current user-defined formats are still working with Output UI, the more sophisticated interfaces need the Post-Processor functionality. Customers who would like to test or to actively support further development can use attached demo license valid till 12th of August.

Please contact us for help or feedback!

New Cutout UI

ENHANCEMENT

TECHN. INFORMATION

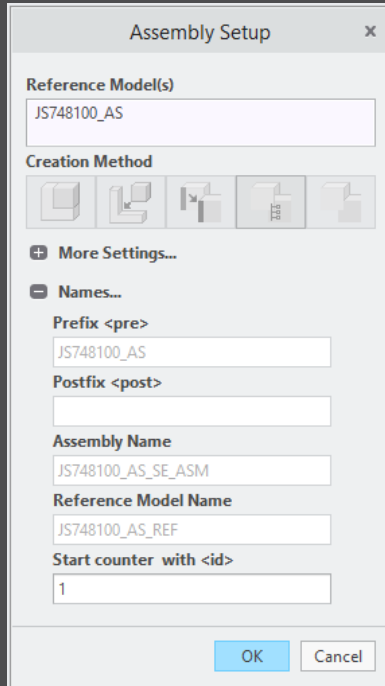

Users can now adjust position and dimensions before solid and cutout are created. UI can be opened again to change values.

Note

This functionality replaces user-defined cutout.

Redefine Assembly

ENHANCEMENT

The screenshot shows the 'Assembly Setup' dialog box with the following fields and options:

- Reference Model(s)**: JS748100_AS
- Creation Method**: Five icons representing different assembly methods.
- More Settings...**: A plus sign icon.
- Names...**: A minus sign icon.
- Prefix <pre>**: JS748100_AS
- Postfix <post>**: (empty)
- Assembly Name**: JS748100_AS_SE_ASM
- Reference Model Name**: JS748100_AS_REF
- Start counter with <id>**: 1

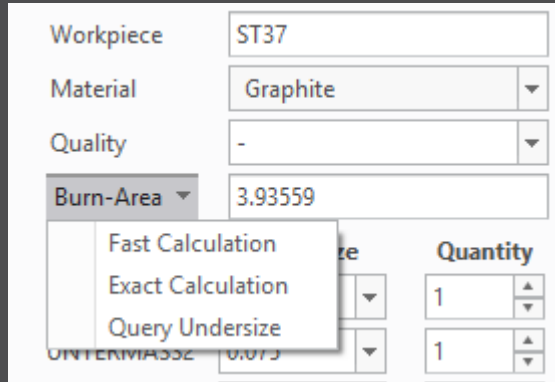

Buttons: OK, Cancel

TECHN. INFORMATION

Electrode assembly definition can be changed again. This may be helpful, especially when working with reference parts. Changes to prefix/postfix or renaming of whole assembly may be added later - feedback welcome!

Burn-Area in Base UI

IMPROVEMENT

The screenshot shows a software interface with the following fields and options:

Workpiece	ST37
Material	Graphite
Quality	-
Burn-Area	3.93559

Below the Burn-Area field, a dropdown menu is open, showing three options:

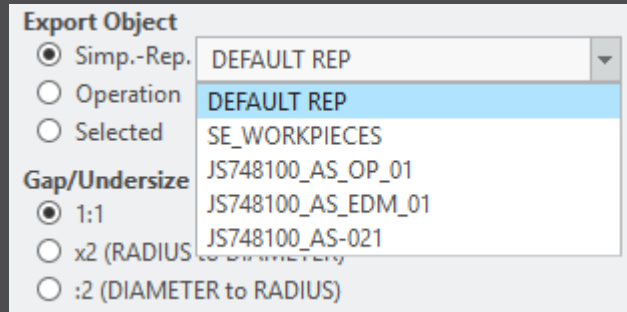

- Fast Calculation
- Exact Calculation
- Query Undersize

To the right of the menu, there are two columns: 'Undersize' and 'Quantity'. The 'Quantity' column has two rows, each with a value of 1 and a small up/down arrow icon.

TECHN. INFORMATION

Added burn-area and workpiece material to Base UI to simplify the workflow. SMARTElectrode performs a fast calculation if no burn-face value available. An exact calculation can be started using the Burn-Area menu. Also the calculation of undersize values can be started directly from this UI. To use this functionality `overburn_calc.txt` has to be customized in configuration.

IMPROVEMENT

TECHN. INFORMATION

- Exports will be named like selected operation by default. All operations of electrode assembly can be exported in a row without changing the name.
- Allow output by simprep. In addition to export by operation or selected electrodes, users can now also select a simplified representation for export. Simplified representations could be added for repair, new electrodes necessary through design change or gate electrodes.
- Allow import and output of operation sub-assemblies from SMARTElectrode 7.0. A new operation has to be defined if new electrodes should be added.
